1.0 Introduction and Summary

The City of Boerne (City) is in the process of updating its water and wastewater impact fees to keep the fee current with its service area and updated CIP information. This report presents HDR Engineering, Inc.'s (HDR) maximum impact fee determination for consideration by the City's Capital Improvements Advisory Committee and the Boerne City Council.

Chapter 395 of the Texas Local Government Code requires an impact fee analysis before impact fees can be created or updated and assessed. Chapter 395 defines an impact fee as "a charge or assessment imposed by a political subdivision against new development in order to generate revenue for funding or recouping the costs of capital improvements or facility expansions necessitated by and attributable to the new development." Chapter 395 identifies the following items as impact fee eligible costs:

- Construction contract price;
- Surveying and engineering fees;
- Land acquisition costs;
- Fees paid to the consultant preparing or updating the capital improvements plan (CIP); and
- Projected interest charges and other financing costs for projects identified in the CIP.

Chapter 395 also identified items that impact fees cannot be used to pay for, such as:

- Construction, acquisition, or expansion of public facilities or assets other than those identified in the capital improvements plan;
- Repair, operation, or maintenance of existing or new capital improvements;
- Upgrading, updating, expanding, or replacing existing capital improvements to serve existing development in order to meet stricter safety, efficiency, environmental, or regulatory standards;
- Upgrading, updating, expanding, or replacing existing capital improvements to provide better service to existing development;
- Administrative and operating costs of the political subdivision
- Principal payments and interest or other finance charges on bonds or other indebtedness, except as allowed above.

The methodology to determine the maximum fee amount considers two options. Consistent with State law, each fee component is calculated with either: (1) consideration of a credit for other methods of payments for utility capital by a new customer, such as through utility rates or taxes, or alternatively, (2) a reduction of the maximum fee amount equal to 50% of the unit capital cost of providing new service. By maximum amounts, this means that the determined fee amount was calculated as the highest that can be lawfully levied by the City, given the prospective land uses and capital improvements plan, the cost of existing and new utility capacity, and consideration of a credit to new customers for capital contributions made through rate payments. The City Council can decide to enact fees less than the maximum amounts shown in this report.

As detailed later in this report, the maximum impact fees were developed in component pieces. For instance, the overall water fee is comprised of separate amounts for water supply, treatment, pumping, elevated storage, ground storage, and transmission. This will facilitate the consideration of offsets or credits from the applicable fee if a developer builds and dedicates eligible facilities to the City or the City provides wholesale service to a neighboring utility and wishes to charge only certain portions of the fee. The maximum fee amounts do not include capital costs for facilities required to be provided by developers at their own expense.

Planning, service demand, and design factor assumptions used in the water and wastewater facility sizing and costing were provided by the City. Data on current utility demand, existing utility assets, needed future facilities, outstanding utility debt, and prospective cash versus debt financing were obtained from or coordinated with the City of Boerne staff. HDR combined these elements into the maximum impact fee calculations presented in this report.

2.0 Utility Service and Fee Application Area

The City's extraterritorial jurisdiction (ETJ) is the City's existing and anticipated 10-year future water and wastewater service area (shown in Figure 1) in which existing and projected land uses, water and wastewater utility demands, and capital improvements needs were assessed.

These fee application areas in its ETJ would be the locations in which Boerne may levy the impact fees, in-part or in-full, if City service is provided. This includes the area served by WCID #2. In addition to the ETJ boundary, the City also provides service to WCID #4 and has an agreement to collect impact fees from this area, thus this area is also included in the impact fee boundary. This boundary does not, however, imply a legal obligation of the City to serve beyond its incorporated limits. If the City does not provide service, in-full or in-part, then the impact fees would not apply.

Figure 1. Water and Wastewater Impact Fees Application Area

3.0 Land Use Assumptions

Table 1 provides an estimate of the current and future land use patterns of the potential water and wastewater service area with information obtained from the 2018 Master Plan. This data was adjusted to account for estimated growth patterns since the plan's completion. This was then modified to show potential changes in land use over a 10-year pattern consistent with the projected land uses in the 2018 Master Plan. Maps of the current and future (10-year) land uses as developed in the 2018 Master Plan are included as Appendix A. About 45.2% of the total impact fee area is currently in residential land uses with 10.0% in commercial or industrial uses. It is estimated that 39.7% of the land area within the impact fee boundary is agricultural, undeveloped, or in open space use.

	Current		Future (Including ETJ)			
Item	Acres	%	Acres	%		
Rural Residential	3,750	13.4%	3,500	12.5%		
Single-Family Residential	8,000	30.4%	12,000	46.5%		
Multi-Family Residential	250	0.9%	400	1.4%		
Mobile/Manufactured Homes	150	0.5%	150	0.5%		
Commercial/Schools/Churches	2,750	9.8%	3,500	12.5%		
Utility/Transportation	400	1.4%	500	1.8%		
Industrial	60	0.2%	120	0.4%		
Government Owned/Parks	1,000	3.6%	1,500	5.4%		
Agricultural/Undeveloped/Open Space	10,473	39.7%	5,163	19.0%		
Total Land Use Acreage	26,833	100%	26,833	100%		
Source: Adapted from Boerne 2018 Master Plan – Technical Plan, August 28, 2018. Land values have been projected from those contained in the plan to be consistent with recent and current growth forecast. Acreage includes the land area of WCID #4.						

Table 1.Current and Projected Land Use

Over time as the City grows into the planning area, developed land areas will both increase and become a higher percentage of overall land uses. Projected residential land uses are expected to increase to 60.9% of total potential service land area and commercial/industrial land use is expected to increase to 12.9% of total land use. Also during this time, the City is likely to experience some growth in other supporting land use types such as utility uses and other

government owned land. It is projected that agricultural, undeveloped land or open space will shrink to 19.0% of the total planning area over the 10-year planning period.

Table 2 shows the current population as well as the projected future population for both the water and wastewater utilities' service area. These were developed to be consistent with the recently completed water demand study.

Utility	2022	2032	% Increase
Water	23,981	37,563	56.6%
Wastewater	22,217	34,745	56.4%

Table 2.Water and Wastewater Service Area Population

4.0 Current and Projected Utility Demand and Supply

Table 3 relates the number of water and wastewater utility connections by water meter size and what is termed a Living Unit Equivalent (or LUE) conversion factor for meters of varying sizes. The values in Table 3 represent the number of LUEs as of June 2022. The standard meter size for a single-family residential house in Boerne is a 5/8" water meter, which is considered to be one LUE.

Based on American Water Works Association standards, the equivalent number of 5/8" meters can be determined for water meters of larger size. In this manner, meters of larger size (i.e., larger potential service demands) can be presented in terms of the equivalent demand of a number of typical single-family homes. For this reason, the LUE concept is a useful tool for being able to apply a base fee amount to service requests of varying meter sizes.

Tables 4 and 5 summarize the City's current and projected water and wastewater service demands and existing supply (service) capabilities by facility. Current and future service demands are also compared with the existing service capacity of the utility systems.

Water demand was forecast using population forecasts from the City of Boerne Supply and Demand Assessment completed in October 2022, water use factors have been determined from City billing data, and meter count/LUE estimates from the City Utility Billing Section. The water demand and wastewater demands are also consistent with recent modeling data to determine the future water and wastewater capital improvement program. With the anticipated growth of the City and surrounding area, potable water utility demand in certain service areas is expected to exceed the existing capacity of water treatment, water pumping, ground storage, and elevated water storage. The City has identified a 10-year water CIP to meet all needs during the planning period, including additional water treatment, water pumping, and ground storage projects. A need for additional wastewater treatment and wastewater pumping capacity was also identified. The City is planning to add additional wastewater treatment and wastewater treatment and wastewater pumping capacity in the next 10-years. In addition, the City has identified wastewater interceptor projects within the future 10-year period that will be needed to service additional growth in certain portions of the wastewater service area.

 Table 5.

 Estimated Wastewater Service Demands and Available Capacity

5.0 Identified Major Capital Improvement Needs and Costs

Given the projected growth in water and wastewater demands, existing capacity, and the modeling of infrastructure needs, various additional facilities have been identified to meet the needs for the next 10 years. The City's 10-year capital need for new capacity totals \$32.8 million for water and \$35.3 million for wastewater (see Appendix B). It is important to note that not all this cost is assigned to new customers in the 10-year planning period.

Given the growth facing the City in the next ten years, improvements are needed in the areas of water, supply, water treatment, pumping, and expansion of the reclaimed water system. Boerne will also need noticeable improvements to its wastewater system, including wastewater treatment plant expansions, pumping and wastewater interceptors that would serve future growth.

Specific projects that accomplish these service capacity goals are identified in Tables 6a and 6b along with their cost and allocation of existing and projected demand to these facilities. The 2022 percent utilization is the portion of a project's capacity required to serve existing development. It is not included in the impact fee eligible analysis and cost calculation. The 2032 percent utilization is the portion of the project's capacity that will be required to serve projected growth and existing customers in the City's service area in 2032. The difference between the 2032 and 2022 percent utilization is the portion of the project's total cost that is used to serve development from 2022 to 2032. This portion of the project's total cost that is used to serve development projected to occur from 2022 to 2032 is calculated as the total actual cost multiplied by the 2022 to 2032 percent utilization. Only this portion of the cost is used in the impact fee analysis. A weighted unit cost of service (\$ per LUE) is then calculated by facility type, based on the proportionate share of use of existing versus new facility capacity by the growth anticipated over the next ten years.

6.0 Consideration of Other Methods of Capital Payment

For utilities that charge an impact fee, the new customer pays for capital in two ways: (1) initially through the up-front impact fee, and (2) over the longer-term through utility rate payments, where typically some portion of customer rate payments also funds capital projects.

The 77th Texas Legislature amended Chapter 395 of the Local Government Code to require either: (1) a calculated credit for rate payments be reflected in the fee amount, or (2) a credit equal to 50% of the total projected cost of the capital improvements plan be given in calculating the maximum fee amount.

Table 7 indicates the estimated cost per LUE that is projected to be borne in the utility rates by the average new customer. The rate credit calculation considered: (1) existing debt, (2) future debt payments incurred in the year in which the facilities would be built and financed, and (3) the projected LUEs at the mid-point year of the weighted average life of the debt for the facilities that are part of the impact fee calculation for each utility.

7.0 Alternative Impact Fee Calculations

Table 8 summarizes the unit capital cost of providing new service and the two alternative credit calculations for new customers. The alternative approach that calculates a specific rate credit (Option A) results in the maximum impact fee calculation of \$2,509 per LUE for water and \$5,120 per LUE for wastewater, totaling \$7,629 per LUE.

As shown in Table 8, the alternative 50% of capital cost method for calculating a rate credit (Option B) results in a lesser water impact fee of \$1,648 per LUE and wastewater fee of \$2,819 per LUE, yielding an overall fee of \$4,467 per LUE.

 Table 8.

 Derivation of Alternative Maximum Water and Wastewater

 Impact Fee Amounts

The fee methodology was replicated for each major facility type in the utility system (e.g., supply, treatment, pumping, elevated storage, ground storage, and transmission) so that the total fee amount is the sum of the component facility fees. This provides a basis for extending the fee to wholesale customers of the City or granting fee offsets if a developer cost-participates with the City on CIP projects.

For comparison purposes, the current impact fees of other near-by cities are listed in Table 9.

City/Utility	Water	Wastewater	Total
New Braunfels Utilities	\$19,448	\$6,244	\$25,692
Fair Oaks Ranch	\$8,670	\$6,069	\$14,739
Boerne – Current	\$5,743	\$3,814	\$9,557
Leander	\$4,309	\$4,452	\$8,761
Boerne – New Maximum	\$2,509	\$5,120	\$7,629
San Antonio Water System	\$4,908	\$2,664	\$7,572
San Marcos	\$3,801	\$2,684	\$6,485
Round Rock	\$4,025	\$2,099	\$6,124
Hutto	\$3,625	\$2,128	\$5,753
Universal City	\$3,881	\$655	\$4,536

8. Advisory Committee Actions and Recommendations

The following summarizes the Capital Improvements Advisory Committee activities during the impact fee updating process:

- On January 10, 2023, the Committee met to:
 - Review Chapter 395 Impact Fee process and requirements.
- On February 6, 2023, the Committee met to:
 - Review population and land use information; and
 - Review CIP information.
 - Review methodology for maximum fee calculation;
 - Review unit cost calculations and maximum fee calculation; and
 - Receive draft report for review.
- On March 6, 2023, the Committee met to:
 - Approve the Impact Fee Report. By approving this report the Committee found the following:
 - The land use assumptions used in the report are reasonable;
 - The CIP used in the report is reasonable; and
 - The method used to calculate the maximum impact fee is reasonable.
 - In addition, the Committee recommends to City Council that the maximum impact fee amount in this document be adopted.
